3.1	A common problem when installing tinytex on a Mac	5

1 Installing R packages

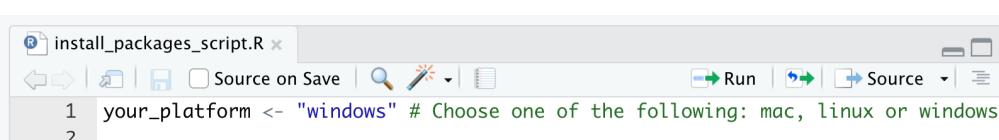

After installing **R** and **R-Studio**, you still need to install a number of so called **R packages**. We will learn more about what packages are and how to use them later. Nevertheless, I strongly recommend you to install already all the packages you will need over the following semester already now. This way you make sure that everything is working now, and you save yourself from trouble during the semester. Moreover, installing these packages is necessary to do the exercises provided after each session.

To install packages, a stable internet connection is required. Then, proceed as follows:

1. Download the script `install_packages_script.R` and save it in a directory of your choice
2. Open the file `install_packages_script.R` in R-Studio. To this end, right-click on the file and select `Open with`, and then choose R-Studio.
3. Adjust the first line of the script to the OS you are using. For instance, when you are using a Mac the file should look like this:

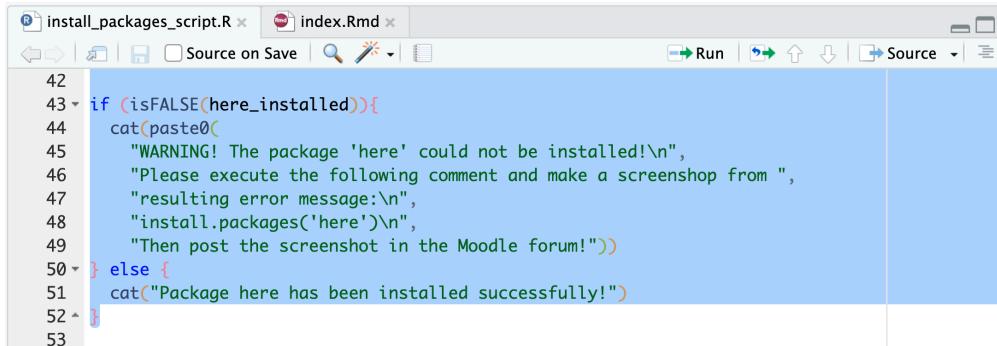

```
install_packages_script.R
Source on Save Run Source
1 your_platform <- "mac" # Choose one of the following: mac, linux or windows
2
```

```
install_packages_script.R
Source on Save Run Source
1 your_platform <- "windows" # Choose one of the following: mac, linux or windows
2
```

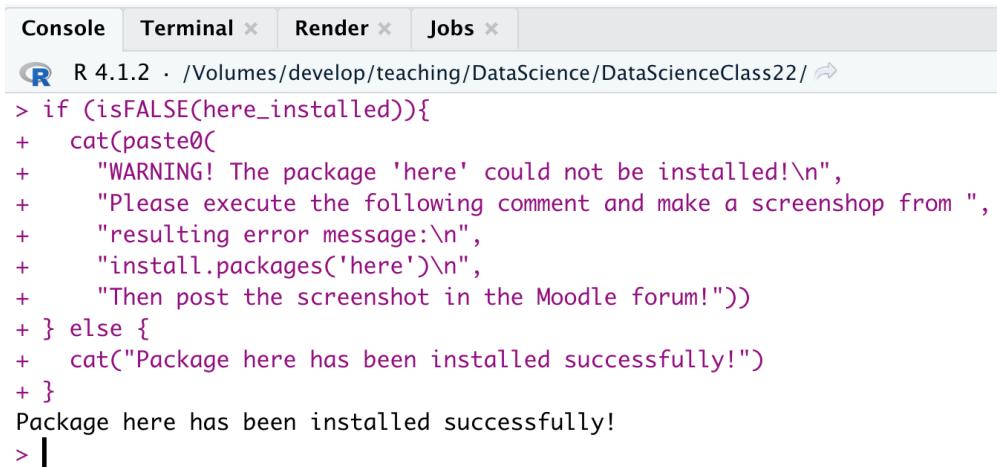

4. Select lines 1-52 and click on the button Run (the screenshot only shows the lines 42-52, the previous lines are also selected):

```
install_packages_script.R x index.Rmd x
Source on Save | Run | Source | Help

42 if (isFALSE(here_installed)){
43   cat(paste0(
44     "WARNING! The package 'here' could not be installed!\n",
45     "Please execute the following command and make a screenshot from ",
46     "resulting error message:\n",
47     "install.packages('here')\n",
48     "Then post the screenshot in the Moodle forum!"))
49 } else {
50   cat("Package here has been installed successfully!")
51 }
52
53
```

5. Check if the package `here` was installed. You will get the respective message in the console:

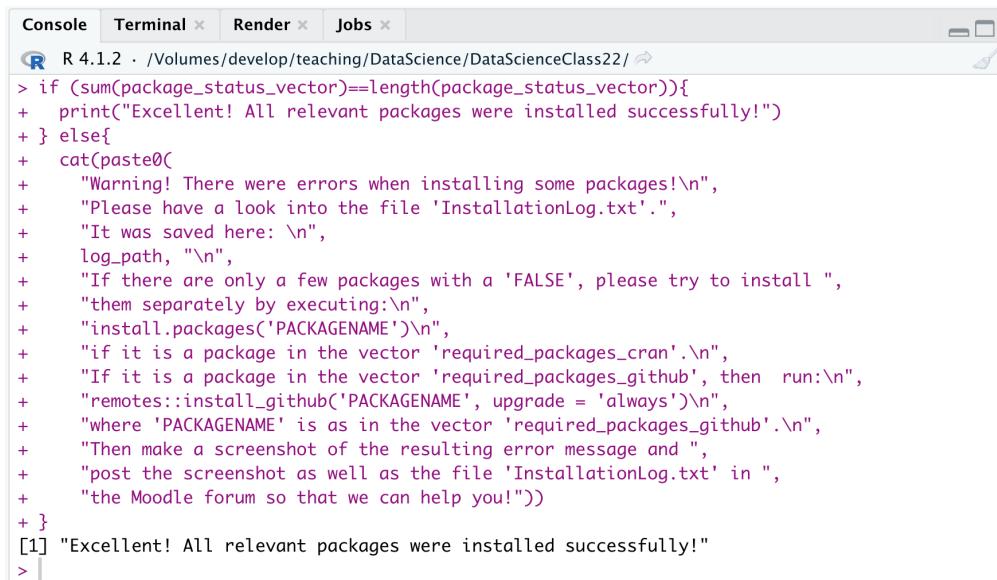

```
Console Terminal x Render x Jobs x
R 4.1.2 · /Volumes/develop/teaching/DataScience/DataScienceClass22/ ↗

> if (isFALSE(here_installed)){
+   cat(paste0(
+     "WARNING! The package 'here' could not be installed!\n",
+     "Please execute the following command and make a screenshot from ",
+     "resulting error message:\n",
+     "install.packages('here')\n",
+     "Then post the screenshot in the Moodle forum!"))
+ } else {
+   cat("Package here has been installed successfully!")
+ }
Package here has been installed successfully!
> |
```

If you encounter any problems, please make a screenshot and post it in the Moodle forum.

6. Select the rest of the script and run it as you did with the first lines. If you get the following message everything worked well and all packages were installed successfully:

```
R 4.1.2 · /Volumes/develop/teaching/DataScience/DataScienceClass22/
> if (sum(package_status_vector)==length(package_status_vector)){
+   print("Excellent! All relevant packages were installed successfully!")
+ } else{
+   cat(paste0(
+     "Warning! There were errors when installing some packages!\n",
+     "Please have a look into the file 'InstallationLog.txt'.",
+     "It was saved here: \n",
+     log_path, "\n",
+     "If there are only a few packages with a 'FALSE', please try to install ",
+     "them separately by executing:\n",
+     "install.packages('PACKAGENAME')\n",
+     "if it is a package in the vector 'required_packages_cran'.\n",
+     "If it is a package in the vector 'required_packages_github', then run:\n",
+     "remotes::install_github('PACKAGENAME', upgrade = 'always')\n",
+     "where 'PACKAGENAME' is as in the vector 'required_packages_github'.\n",
+     "Then make a screenshot of the resulting error message and ",
+     "post the screenshot as well as the file 'InstallationLog.txt' in ",
+     "the Moodle forum so that we can help you!")
+ }
[1] "Excellent! All relevant packages were installed successfully!"
> 
```

If not, please post the file `InstallationLog.txt` and a screenshot with an error into the Moodle forum.

Note: maybe you will see the following message during the installation process (possible multiple times):

```
There is a binary version available but the source version is later:
  binary source needs_compilation
xfun    0.29    0.30      TRUE

Do you want to install from sources the package which needs compilation? (Yes/no/cancel) |
```

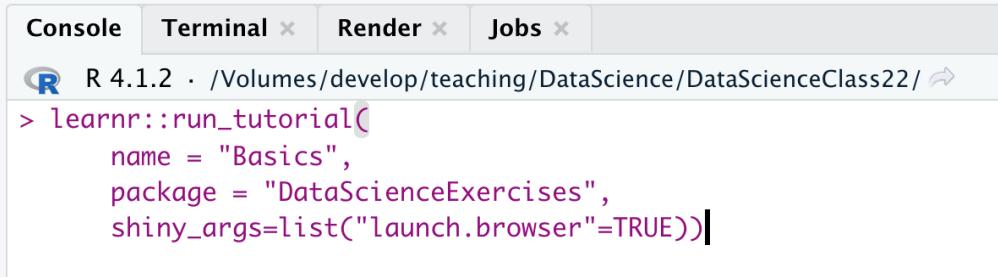

I recommend to type `No` and press enter. If, for any reason, the installation process is not successful you might run the installation commands again and try responding with `Yes`, this might sometimes fix the problem.

2 Verify the usability of exercises

If everything worked well until here you should be able to access the exercise sheets that I provide you with after each session. To make sure everything works as expected, please run the following command in the console and press enter:

```
learnr::run_tutorial(
  name = "Basics",
  package = "DataScienceExercises",
  shiny_args=list("launch.browser"=TRUE))
```

This means you type it like this and press enter:

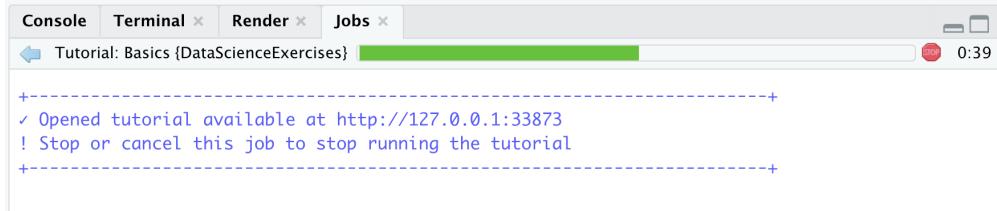

The screenshot shows the RStudio interface with the Terminal tab selected. The terminal window displays the following R code:

```
R 4.1.2 · /Volumes/develop/teaching/DataScience/DataScienceClass22/ ↵
> learnr::run_tutorial(
  name = "Basics",
  package = "DataScienceExercises",
  shiny_args=list("launch.browser"=TRUE))|
```

If the exercise window opens, everything is well, if not, please describe your problem in the Moodle forum.

After you closed the window and the process is still active, just click on the **Stop** button in R-Studio:

And then click on the **Console** tab on the left to return to the console.

3 Installing LaTeX

To create PDF-documents you have to install a [Latex distribution](#). I recommend you to install the distribution [tinytex](#), no matter whether you already have a different distribution or not.

I recommend installing tinytex via Quarto. You should have installed Quarto during [this tutorial](#), but in case you did not, just follow the instructions on [this webpage](#).

Then follow the instructions from [this tutorial](#). What you essentially need to do is to open your terminal and issue the following command:

```
quarto install tinytex
```

To make sure everything runs smoothly you should download the document [test_pdf.qmd](#) (its a zip file that you first need to extract).

To test whether everything works, please open `test.qmd` in R-Studio and then click on the button **Render** (which is a couple of buttons left of Run).

If this works you are all set. If there are any errors showing up, please post a screenshot and a problem description to the Moodle forum.

3.1 A common problem when installing `tinytex` on a Mac

The following hints should be helpful if after the attempted installation of `tinytex` you see either one of these error messages:

```
> tinytex::install_tinytex()
versuche URL 'https://yihui.org/tinytex/TinyTeX-1.zip'
Content type 'application/octet-stream' length 99803989 bytes (95.2 MB)
downloaded 95.2 MB

tlmgr conf auxtrees add "C:/PROGRA~1/R/R-40~1.3/share/texmf"
Warnmeldung:
In file(con, "r") :
  kann Datei '/texmf-dist/web2c/fmtutil.cnf' nicht öffnen: No such file or directory
> |
```

```
> tinytex::install_tinytex()
The directory /usr/local/bin is not writable. I recommend that you make it writable. See https://github.com/yihui/tinytex/issues/24 for more info.

versuche URL 'https://yihui.org/tinytex/TinyTeX-1.tgz'
Content type 'application/octet-stream' length 64852342 bytes (61.8 MB)
=====
downloaded 61.8 MB

add_link_dir_dir: destination /usr/local/bin not writable, no links from /Users/sinja/Library/TinyTeX/bin/x86_64-darwin.
tlmgr: An error has occurred. See above messages. Exiting.
TLUtils::add_remove_symlinks: add of symlinks had 1 error(s), see messages above.
> |
```

In this case, execute the following command in your R console within R-Studio:

```
tinytex::install_tinytex(force = TRUE)
```

Then close R-Studio and restart your computer. If `test_pdf.qmd` still cannot be compiled after this, please open your Mac Terminal (via the app `Terminal`) and enter the following commands:

```
sudo chown -R `whoami`:admin /usr/local/bin
~/Library/TinyTeX/bin/x86_64-darwin/tlmgr path add
```

Then install `tinytex` again as described above, restart your computer, and try to compile `test_pdf.qmd` again.
